MANAGEMENT REVIEW

Management without theatre.

ROLE

LEADING REMOTELY

A randomised trial of two days at home, the gap between how employees and leaders see productivity, three paths in 46 studies, the bridges distance removes, what to measure and a card for a team agreement.

33% fewer quits when employees could work from home two days a week, in a randomised trial with 1,612 people. Their performance reviews did not change.

NO. 67 · ROLE

In this issue

More and more teams do not share a room every day. A manager who cannot see the work has to lead it another way: through results, clear priorities and agreements the team makes together. What does the research show, and what can a remote leader do with it?

In a randomised trial at Trip.com, two days at home cut quits by a third without hurting performance reviews. Microsoft found that 85% of leaders struggle to trust that hybrid staff are productive. A meta-analysis of 46 studies shows three paths and a threshold of 2.5 days a week. Data from Microsoft and a Fortune 500 firm show what distance takes away: bridges between groups, and feedback for the young. Gallup shows what to measure and what a team agreement holds.

HOW TO READ THIS ISSUE

Figure
Every figure has its source and year at the foot of its page.

Our reading
Where the editors interpret rather than the research, it says so.

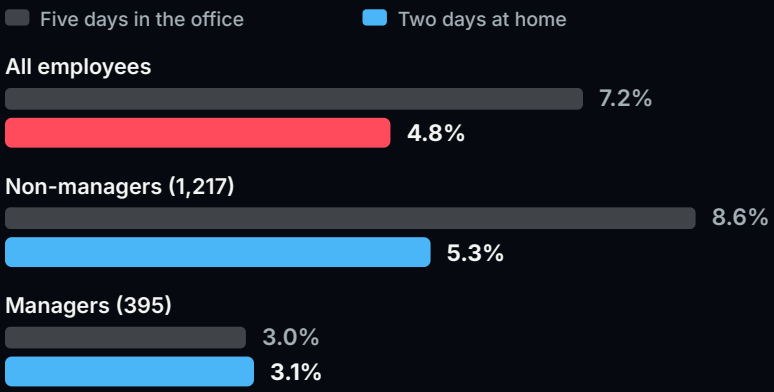

Practice
The steps and the card are proposals to try, not research results.

COVER STORY

Two days at home

In August 2021 the travel company Trip.com split 1,612 graduates in engineering, marketing and finance by birthday. Those born on an odd day could work from home on Wednesdays and Fridays; the rest came in five days a week. Nicholas Bloom, Ruobing Han and James Liang followed them.

QUIT RATE DURING THE TRIAL, AUGUST 2021 TO JANUARY 2022

Performance grades and promotions over the next two years did not differ, and neither did the code the engineers wrote. The 395 managers had expected hybrid work to cut productivity by 2.6%; after the trial, they expected a gain of 1.0%. The company then extended the arrangement to all staff.

OUR READING

Six months of their own data convinced the managers where argument had not.

Source: Nicholas Bloom, Ruobing Han & James Liang, Nature 630, 2024

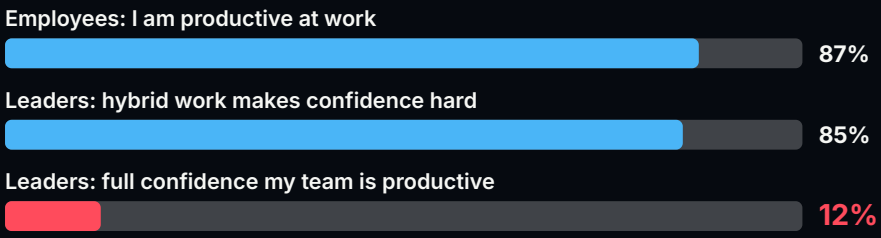

Co-author James Liang co-founded Trip.com and chairs its board; the firm did not fund the study. Most took one day at home, usually Friday.

THE NUMBERS

Productivity paranoia

In the summer of 2022 Microsoft surveyed 20,006 knowledge workers in 11 countries, Germany among them. It called the gap it found productivity paranoia: leaders fear that lost productivity comes from people not working.

KNOWLEDGE WORKERS IN 11 COUNTRIES, JULY AND AUGUST 2022

In the same survey, 81% of employees said it is important that their manager helps them prioritise their workload. Less than a third, 31%, said their manager had ever given clear guidance in one-on-ones.

OUR READING

A leader who cannot see the work is tempted to count activity. The team needs priorities more than it needs to be watched.

Source: Microsoft, Work Trend Index Special Report, 2022

Online survey by Edelman Data & Intelligence, 7 July to 2 August 2022, at least 2,000 per country. It records what people say about their work, not measured output.

THE MODEL

Three paths, one threshold

In 2007 Ravi Gajendran and David Harrison combined 46 field studies with 12,883 employees. Working away from the office acted through three paths, they found, and its effects were small but mostly good.

01

Autonomy

more control over how and when; the main path to the benefits

02

Work and family

less conflict, and less still with more days away

03

Relationships

slightly better with the manager; with colleagues unchanged, up to 2.5 days a week

Job satisfaction rose, while intent to quit and role stress fell. Performance rated by supervisors or records was higher; self-rated performance was not. Career prospects did not suffer. Beyond 2.5 days a week away, relationships with colleagues worsened. The authors suggest a day when the group is together, and treating remote work as normal rather than as a privilege.

OUR READING

Distance leaves the tie to the manager intact and thins the ties between colleagues. Someone has to rebuild those on purpose.

Source: Ravi S. Gajendran & David A. Harrison, Journal of Applied Psychology 92(6), 2007

Correlations from field studies up to 2007, mostly not experiments; the effects are small. The three paths are the authors'; the short descriptions are the editors'.

WHAT THE RESEARCH SAYS

Fewer bridges, less feedback

Longqi Yang and colleagues compared 61,182 Microsoft employees in the US in the first half of 2020: those who already worked remotely before the pandemic and those whom the firm-wide move sent home. Remote work made the network more static and siloed, with fewer bridges between groups.

−25%
share of collaboration time with people in other groups, about a quarter below its level before (Microsoft, 2020)

−5%
meeting and call hours; email and chat grew instead

+18.3%
feedback on code for engineers who sat near their teammates (Fortune 500 firm, 2019–2024)

Natalia Emanuel, Emma Harrington and Amanda Pallais followed software engineers through office closures and later return-to-office mandates. Sitting near teammates raised feedback and code quality, above all for younger and newer engineers; experienced engineers wrote less code.

OUR READING

Planned work survives distance. What gets lost is what nobody plans: the quick question, the contact in another team. A remote leader has to plan it.

Sources: Longqi Yang, David Holtz, Sonia Jaffe et al., Nature Human Behaviour 6, 2022 (via Abstract at Nature; figures from the authors' summary at Microsoft Research); Natalia Emanuel, Emma Harrington & Amanda Pallais, NBER Working Paper 31880 (revised 2026), 2023

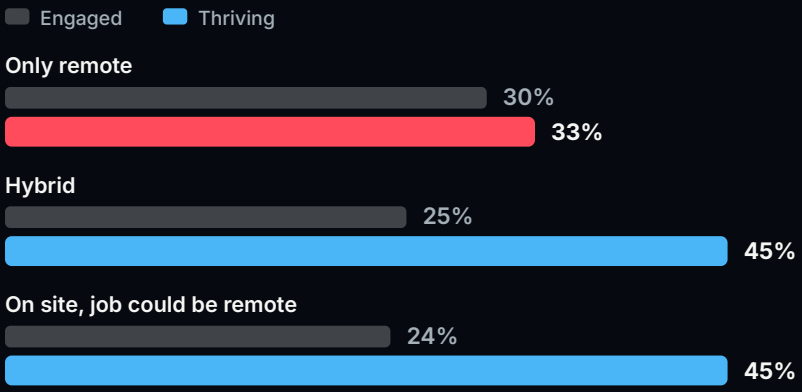

Microsoft: one firm, during the pandemic; the two figures come from the authors' summary, as the full article was behind a paywall. Emanuel et al.: a working paper from one firm.

HOW IT IS MEASURED

More than one number

Where people work says little on its own. In Gallup's 2025 global data, employees who worked only remotely were the most engaged, and among the least likely to be thriving in their lives.

EMPLOYEES BY PLACE OF WORK, WORLDWIDE, 2025

01	**Results**	what was agreed and delivered, not hours online
02	**Clarity**	in the US it fell twice as fast for hybrid and remote staff (Gallup, 2024)
03	**Connection**	lonely the day before: 24% remote and hybrid, 18% on site

Sources: Gallup, State of the Global Workplace 2026; Gallup, Hybrid Work and Productivity: What the Data Show, 2026

Gallup World Poll, 141,444 employed respondents in 2025; the on-site figures are for jobs that could be done remotely. The choice of these three measures is the editors' reading of the sources.

TOOL OF THE ISSUE

The team agreement card

In 2024, 48% of hybrid workers told Gallup their team had never discussed a plan for working together. Teams with one were 66% more likely to be engaged and 29% less likely to be burned out. Write the plan with the team, and review it.

01 Channels which channel for what: urgent, routine, decisions

02 Response times how fast in each channel; how to say you are unavailable

03 Check-ins the team check-in and each weekly one-to-one: when

04 Escalation what counts as a problem, whom to tell, by when; who owns it until closed

05 Written down decisions, handovers, open issues with an owner and a time

06 Together which day in person, and what for; the next review date

Sources: Gallup, 2026; Ravi S. Gajendran & David A. Harrison, Journal of Applied Psychology 92(6), 2007

A practice the editors propose, drawing on Gallup (the most common practices in teams with a plan: check-ins, availability, unavailability) and Gajendran & Harrison (a day together). Gallup compared teams with and without a plan, so this is an association, not a cause.
