MANAGEMENT REVIEW

Management without theatre.

OPERATIONS

PDCA: THE CYCLE THAT DOES NOT END

Shewhart's circle of 1939, how a lecture in Japan became PDCA, why Deming wanted study and not check, how few teams run more than one cycle, what reported success hides, and a card for one cycle.

4% of the PDSA projects that could be judged applied all four key features of the method; 98% of all the projects reported improvement.

NO. 80 · OPERATIONS

In this issue

PDCA is on almost every improvement poster, drawn as a circle. In practice it is often run as a line: plan, do, and stop. This issue follows the cycle from Shewhart to Deming and asks what it takes to go round more than once. It closes the second series.

In 1939 Walter Shewhart drew specification, production and inspection as a circle, not a line. Deming's lectures in Japan in 1950 became the Deming wheel, and then PDCA; Deming later insisted on PDSA, with study in place of check. In a review of 73 healthcare reports, fewer than one in five documented a sequence of linked cycles. In 120 later projects almost all reported improvement, yet only 4% of those that could be judged applied the method fully. Five marks show whether a cycle closes, and a card helps run one.

HOW TO READ THIS ISSUE

Figure
Every figure has its source and year at the foot of its page.

Our reading
Where the editors interpret rather than the research, it says so.

Practice
The steps and the card are proposals to try, not research results.

COVER STORY

From a line to a circle

In 1938 Walter Shewhart of Bell Telephone Laboratories lectured to the US Department of Agriculture's Graduate School; in 1939 the lectures became a book, with W. Edwards Deming as editorial assistant. Quality control, he wrote, has three steps: specification, production, inspection.

Run as a straight line, the steps end at inspection, with a verdict on the product. Shewhart drew them as a circle: what inspection finds goes back into the next specification.

1939
Shewhart: specification, production, inspection, as a circle.

1950
Deming in Japan: design, make, sell, test in service, redesign: the “Deming wheel”.

1951
Japanese participants recast the wheel as Plan, Do, Check, Act.

1993
Deming: Plan, Do, Study, Act, “the Shewhart cycle for learning and improvement”.

OUR READING

A line ends with a verdict on the product. A circle ends with a question for the next round.

Sources: Walter A. Shewhart, Graduate School of the US Department of Agriculture, 1939 (via Summaries of Moen & Norman (2010)); Ronald Moen & Clifford Norman, Quality Progress, 2010 (via Summaries by Quality Digest and the Deming Institute); W. Edwards Deming, MIT Center for Advanced Engineering Study, 1993 (via The W. Edwards Deming Institute, "PDSA Cycle")

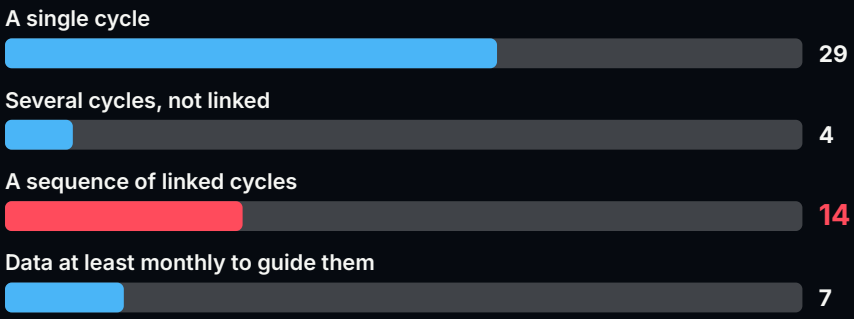

The history follows Moen & Norman (2010), read only in summaries; Shewhart's book was not seen either. The 1950 steps are Deming's, shortened, from a seminar for managers and engineers.

THE NUMBERS

One cycle, then stop

Taylor, Reed and colleagues searched the healthcare literature for reports of improvement work that said it used PDSA. Of 409 articles, 73 met their criteria; 47 described their cycles in enough detail to be checked against the method.

THE 47 REPORTS THAT DESCRIBED THEIR CYCLES (2014)

Of all 73 reports, fewer than one in five fully documented a sequence of linked cycles. Most did not report the method's key features: iterative cycles, tests of change, and data used in real time.

OUR READING

Most teams called it a cycle and ran it once. One round is a trial, not a cycle.

Source: Michael J. Taylor et al., BMJ Quality & Safety 23(4), 2014 (via Abstract and excerpts of the full text)

Published reports may describe the work less fully than it was done. The bars count reports, not teams. We read the abstract and excerpts of the full text; the article itself did not open.

THE MODEL

Check or study

Deming never taught PDCA. In The New Economics (1993) his cycle is Plan, Do, Study, Act. The Japanese PDCA went another way: Kaoru Ishikawa (1985) split plan and do into six steps.

PDCA, Ishikawa (1985)	PDSA, Deming (1993)
Set goals and targets	Plan a change, with a theory
Decide the methods	Do it, preferably small
Educate and train	Study: did it match the hopes?
Do the work	Act: adopt, abandon, or go again
Check the effects	
Take action	

Check, says the Deming Institute, asks whether a change worked; study compares the results with a prediction and may revise the theory. In 1990 Deming wrote to Ronald Moen:

“Be sure to call it PDSA, not the corruption PDCA.”

OUR READING

Check asks: did we do it? Study asks: were we right, and what do we believe now?

Sources: Kaoru Ishikawa, translated by David J. Lu, Prentice-Hall, 1985 (via University of Cambridge, Institute for Manufacturing); W. Edwards Deming, MIT Center for Advanced Engineering Study, 1993 (via The W. Edwards Deming Institute, "PDSA Cycle"); Ronald Moen & Clifford Norman, Quality Progress, 2010 (via Summaries by Quality Digest and the Deming Institute)

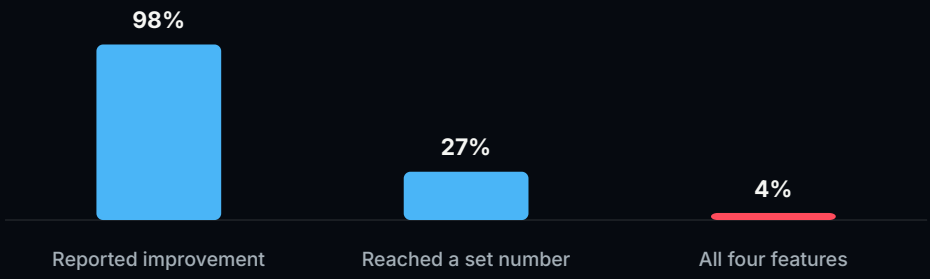

Ishikawa via the University of Cambridge; Deming's steps and letter via the Deming Institute and summaries of Moen & Norman. The Model for Improvement is in No. 69.

WHAT THE RESEARCH SAYS

Success reported, method missing

Knudsen and colleagues at Aalborg University reviewed 120 improvement projects that used PDSA and were published in peer-reviewed journals in 2015 and 2016.

PDSA PROJECTS PUBLISHED IN 2015–2016 (2019)

The four features were iterative cycles, data collected over time, testing on a small scale first, and a stated rationale for the change. Only 72 projects described their cycles well enough to be judged; three of them had all four. The authors see a challenge to the legitimacy of PDSA-based improvement.

OUR READING

When almost every project succeeds on paper, the success says little. How the cycles were run says more.

Source: Søren Valgreen Knudsen, Henrik Vitus Bering Laursen, Søren Paaske Johnsen et al., BMC Health Services Research 19, 2019 (via Abstract and summaries)

Results as the projects reported them; journals favour success. 98% and 27% are of all 120 projects, 4% of the 72 that could be judged. Read in the abstract and summaries; the full text did not open.

HOW IT IS MEASURED

Did the cycle close?

The two reviews judged the reports by a few marks. A team can apply the same marks to its own cycles, before anyone counts the result.

01	**Prediction written first**	What we expect, and why, noted before the test starts.
02	**Small first, then larger**	One shift or one area before the whole site; scale grows with confidence.
03	**Data over time**	The measure at regular points, not one before and one after.
04	**The next cycle linked**	Each cycle starts from what the last one taught.
05	**Act recorded**	Adopted as the standard, adapted or dropped, and who checks that it holds.

OUR READING

A cycle closes when Act changes the standard and someone keeps checking it. Otherwise the gain lasts as long as the attention.

Sources: Michael J. Taylor et al., BMJ Quality & Safety 23(4), 2014 (via Abstract and excerpts of the full text); Søren Valgreen Knudsen, Henrik Vitus Bering Laursen, Søren Paaske Johnsen et al., BMC Health Services Research 19, 2019 (via Abstract and summaries)

The first four marks follow Taylor et al. (2014) and Knudsen et al. (2019); the last mark and the selection are the editors'. Standard work and kaizen are in No. 35.

More in the essay When improvement fades

TOOL OF THE ISSUE

The PDSA cycle card

One card per cycle, filled in with the people who will run the test. Study needs data over time: a control chart shows whether a change in the numbers is a signal or noise.

01 The change one change, and the problem it should solve

02 Prediction which measure moves, by about how much, and why

03 The test where, who, how long; smaller than the whole area

04 What happened the measure at regular points, and anything unplanned

05 Study results against the prediction: what did we learn?

06 Act adopt as standard, adapt or abandon; who checks it holds; date of the next cycle

Sources: W. Edwards Deming, MIT Center for Advanced Engineering Study, 1993 (via The W. Edwards Deming Institute, "PDSA Cycle"); Michael J. Taylor et al., BMJ Quality & Safety 23(4), 2014 (via Abstract and excerpts of the full text); Søren Valgreen Knudsen, Henrik Vitus Bering Laursen, Søren Paaske Johnsen et al., BMC Health Services Research 19, 2019 (via Abstract and summaries)

A practice proposed by the editors, after Deming's PDSA steps and the marks used by Taylor et al. (2014) and Knudsen et al. (2019).

EDITORIAL METHOD

Each figure was checked for its year, its publisher and what exactly it measures. Where the publisher's page could not be opened, the figure was checked against independent summaries and is marked “via”. The editors' interpretation is marked “Our reading”. Figures that could not be confirmed are not in the issue.
